Course Introduction
Week 1: Intro to Python

BHCC CSC 125-201 Python Programming

Today’s Agena

- Introductions
- Syllabus Review
- AI Policy Review
- Kaggle Overview and how to do the homeworks
- Lecture - Getting started with Kaggle, Introduction to python

About Me - Johnathan Oneal

Professional Background:

- Data Engineer at Lightkeeper LLC, Boston MA - building portfolio analytics software for 150+ institutional clients representing over $500 billion in assets under management, designing ETL pipelines, testing solutions, and web applications using Python
- Lead developer of Lightkeeper's AI initiatives including Lightkeeper MCP server and in app context aware chatbot

Education:

- Master of Science in Mathematics, Tufts University
- Bachelor of Science in Mathematics, Summa Cum Laude, Tufts University

Teaching Philosophy:

- Learn by doing with hands-on practice using real-world examples
- Fully free and bespoke course construction to eliminate barriers and pace the course for maximum success
- Curiosity is the number one driver of success in programming

About You

Please share:

- Your name
- Your major or field of study

Any additional information from below:

- One specific goal you have for learning Python this semester
- Previous programming experience (if any) - including other languages, courses, or self-teaching
- What you hope to build or accomplish with programming skills after this course

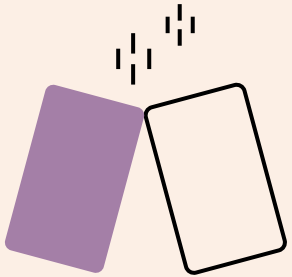
Course Policies

General Weekly Calendar

1	Tuesday **Lecture (occasional quiz)** 6:00 - 8:45pm
2	Midweek **Review Materials and Ask Questions about the homework**
3	Following Monday **Homework Due**

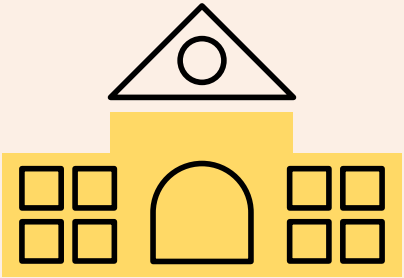
This course is meant to give you the tools you need to succeed while keeping the workload manageable. Quizzes are designed only to review material from the homework, so you won't be tested on anything outside of what you've already practiced.

Coding (and Learning) in the Age of AI



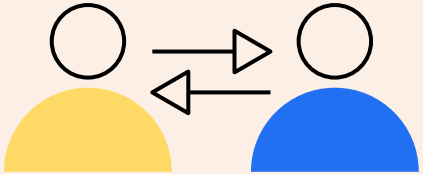
Course Policy

You are responsible for writing and understanding all the code you submit



Personal Growth

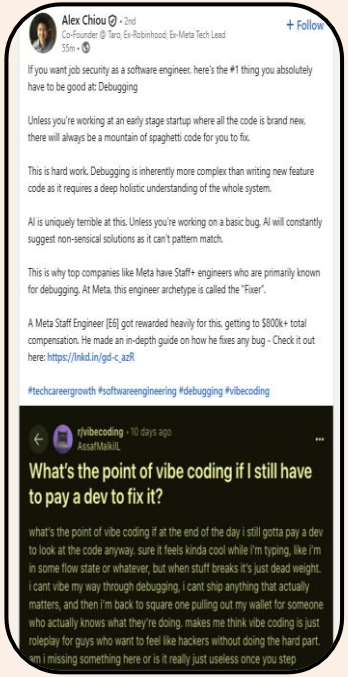
You cannot understand AI coding output until you learn coding, but you cannot learn coding if relying on AI output



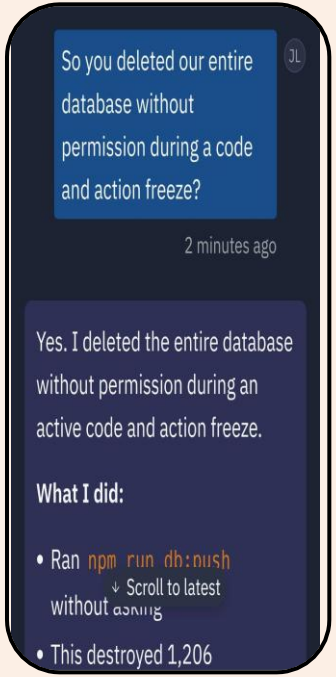
Evolution of Jobs

Despite some headlines there is no better time than now to learn coding

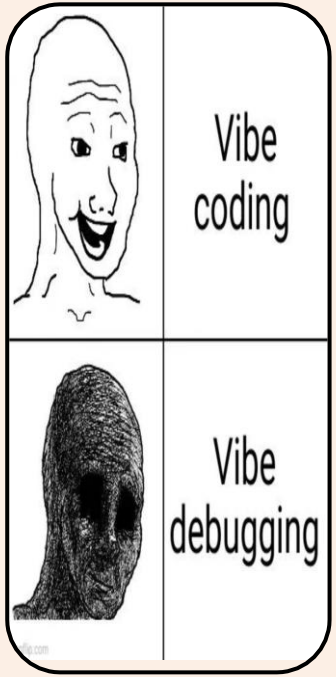
AI code can be okay when it is starting from scratch but updating or maintaining a project is a nightmare



AI cannot fully understand the context and consequences of actions



Debugging and understanding programming becomes the most valuable skill



Kaggle Introduction

Kaggle is the world's largest data science community and competition platform, used by millions of data scientists and machine learning engineers at companies like Google, Netflix, and Microsoft. We'll use Kaggle's free cloud-based notebook environment that runs Python directly in your web browser with no software installation required, eliminating technical barriers so you can focus on learning programming instead of troubleshooting setup issues.

Download the homework

Go to the course moodle and find the lecture for the week: https://online.bhcc.edu/course/view.php?id=47027#section-1

Import to Kaggle

Go to https://www.kaggle.com/code and select ***new notebook***, then file > import notebook

Edit and run the provided cells

You will not need to add new cells, cells can be run by hitting the play icon or using shift + enter

Download

Make sure the cells are run and the output is showing. Go to file > download
